

# Bovibooster STARTUP GUIDE

## BEFORE INSTALLATION:

Bovibooster is a preventive treatment system that is able to remove up to 90% of skin related problems.

In order to have a preventive treatment system running, you need to deal with the cows that already have problems.

Therefore, we recommend that you make an agreement with your local hoof trimmer to visit you 1-2 times before installing the Bovibooster, in order to make a zero-tolerance treatment of all cows.

This also ensures that the cows don't have any pain in the introduction period, so you avoid problems with cow that resist being milked.

## INTRODUCTION PERIOD:

The pre-set program is set to 7/7 days with wash and 3/7 days with a care-product/chemical.

We recommend starting with 7/7 days with wash and 7/7 days with a care-product/chemical for the first 2 weeks.

Then slowly adjust depending on how the overall problems look.

The first 1-2 weeks it is recommended to adjust the water with a bar-pressure that is the lowest possible setting. This can vary depending on your tap-water pressure.

The concentration of care product/chemical should be higher in the introduction period.

## TO SUM UP:

You can adjust these different parameters to get the best introduction in your herd:

- Treatment days with water and care product/chemical
- Water pressure
- Concentration of hoof care product/chemical.

## AFTER THE INTRODUCTION PERIOD:

We recommend that you balance the 3 parameters above with the hoof health in your herd to secure the best and most cost-effective treatment. If you at some point get problems, adjust to keep your hoof problems at bay.
